131                                     <1> ;;    At first,
132                                     <1> ;;    - 'allocate page' procedure will be called;
133                                     <1> ;,       if it will return with a valid (>0) physical address
134                                     <1> ;;       (that means the relevant M.A.T. bit has been RESET)
```

```
<1> ;;       relevant memory page/block will be cleared (zeroed).
<1> ;;    - 'allocate page' will be called for allocating page
<1> ;;       directory, page table and running space (data/code).
<1> ;;    - every successful 'allocate page' call will decrease
<1> ;;      'free_pages' count (pointer).
<1> ;;    - 'out of (insufficient) memory error' will be returned
<1> ;;      if 'free_pages' points to a ZERO.
<1> ;;    - swapping out and swapping in (if it is not a new page)
<1> ;;      procedures will be called as responce to 'out of memory'
<1> ;;      error except errors caused by attribute conflicts.
<1> ;;     (swapper functions)
<1> ;;
<1> ;;    At second,
<1> ;;    - page directory entry will be updated then page table
<1> ;;      entry will be updated.
<1> ;;
<1> ;; MEMORY ALLOCATION TABLE FORMAT:
<1> ;;    - M.A.T. has a size according to available memory as
<1> ;;      follows:
<1> ;;            - 1 (allocation) bit per 1 page (4096 bytes)
<1> ;;            - a bit with value of 0 means allocated page
<1> ;;            - a bit with value of 1 means a free page
<1> ;,    - 'free_pages' pointer holds count of free pages
<1> ;;      depending on M.A.T.
<1> ;;          (NOTE: Free page count will not be checked
<1> ;;          again -on M.A.T.- after initialization.
<1> ;;          Kernel will trust on initial count.)
<1> ;,    - 'free_pages' count will be decreased by allocation
<1> ;;      and it will be increased by deallocation procedures.
<1> ;;
<1> ;;    - Available memory will be calculated during
<1> ;;      the kernel's initialization stage (in real mode).
<1> ;;      Memory allocation table and kernel page tables
<1> ;;      will be formatted/sized as result of available
<1> ;;      memory calculation before paging is enabled.
<1> ;;
<1> ;; For 4GB Available/Present Memory: (max. possible memory size)
<1> ;;    - Memory Allocation Table size will be 128 KB.
<1> ;;    - Memory allocation for kernel page directory size
<1> ;;      is always 4 KB. (in addition to total allocation size
<1> ;;      for page tables)
<1> ;;    - Memory allocation for kernel page tables (1024 tables)
<1> ;;      is 4 MB (1024*4*1024 bytes).
<1> ;;    - User (available) space will be started
<1> ;;      at 6th MB of the memory (after 1MB+4MB).
<1> ;;    - The first 640 KB is for kernel's itself plus
<1> ;;      memory allocation table and kernel's page directory
<1> ;;      (D0000h-EFFFFh may be used as kernel space...)
<1> ;;    - B0000h to B7FFFh address space (32 KB) will be used
<1> ;;      for buffers.
<1> ;;    - ROMBIOS, VIDEO BUFFER and VIDEO ROM space are reserved.
<1> ;,      (A0000h-AFFFFh, C0000h-CFFFFh, F0000h-FFFFFh)
<1> ;;    - Kernel page tables start at 100000h (2nd MB)
<1> ;;
<1> ;; For 1GB Available Memory:
<1> ;;    - Memory Allocation Table size will be 32 KB.
<1> ;;    - Memory allocation for kernel page directory size
<1> ;;      is always 4 KB. (in addition to total allocation size
<1> ;;      for page tables)
<1> ;;    - Memory allocation for kernel page tables (256 tables)
<1> ;;      is 1 MB (256*4*1024 bytes).
<1> ;;    - User (available) space will be started
<1> ;;      at 3th MB of the memory (after 1MB+1MB).
<1> ;;    - The first 640 KB is for kernel's itself plus
<1> ;;      memory allocation table and kernel's page directory
<1> ;;      (D0000h-EFFFFh may be used as kernel space...)
<1> ;;    - B0000h to B7FFFh address space (32 KB) will be used
<1> ;;      for buffers.
<1> ;;    - ROMBIOS, VIDEO BUFFER and VIDEO ROM space are reserved.
<1> ;,      (A0000h-AFFFFh, C0000h-CFFFFh, F0000h-FFFFFh)
<1> ;;    - Kernel page tables start at 100000h (2nd MB).
<1> ;;

<1> ;;
<1> ;; RETRO UNIX 386 v1 - Paging (Method for Copy On Write paging principle)
<1> ;; DEMAND PAGING - PARENT&CHILD PAGE TABLE DUPLICATION PRINCIPLES (23/04/2015)
<1>
<1> ;; Main factor: "sys fork" system call
<1> ;;
<1> ;;          FORK
<1> ;;                        |----> parent - duplicated PTEs, read only pages
<1> ;;  writable pages ---->|
<1> ;;                        |----> child - duplicated PTEs, read only pages
<1> ;;
<1> ;; AVL bit (0) of Page Table Entry is used as duplication sign
<1> ;;
<1> ;; AVL Bit 0 [PTE Bit 9] = 'Duplicated PTE belongs to child' sign/flag (if it is set)
<1> ;; Note: Dirty bit (PTE bit 6) may be used instead of AVL bit 0 (PTE bit 9)
<1> ;;       -while R/W bit is 0-.
<1> ;;
<1> ;; Duplicate page tables with writable pages (the 1st sys fork in the process):
<1> ;; # Parent's Page Table Entries are updated to point same pages as read only,
<1> ;;   as duplicated PTE bit  -AVL bit 0, PTE bit 9- are reset/clear.
<1> ;; # Then Parent's Page Table is copied to Child's Page Table.
<1> ;; # Child's Page Table Entries are updated as duplicated child bit
<1> ;;   -AVL bit 0, PTE bit 9- is set.
<1> ;;
<1> ;; Duplicate page tables with read only pages (several sys fork system calls):
<1> ;; # Parent's read only pages are copied to new child pages.
<1> ;;   Parent's PTE attributes are not changed.
<1> ;;   (Because, there is another parent-child fork before this fork! We must not
<1> ;;    destroy/mix previous fork result).
```

```
                        <1> ;; # Child's Page Table Entries (which are corresponding to Parent's
                        <1> ;;   read only pages) are set as writable (while duplicated PTE bit is clear).
                        <1> ;; # Parent's PTEs with writable page attribute are updated to point same pages
                        <1> ;;   as read only, (while) duplicated PTE bit is reset (clear).
                        <1> ;; # Parent's Page Table Entries (with writable page attribute) are duplicated
                        <1> ;;   as Child's Page Table Entries without copying actual page.
                        <1> ;; # Child 's Page Table Entries (which are corresponding to Parent's writable
                        <1> ;;   pages) are updated as duplicated PTE bit (AVL bit 0, PTE bit 9- is set.
                        <1> ;;
                        <1> ;; !? WHAT FOR (duplication after duplication):
                        <1> ;; In UNIX method for sys fork (a typical 'fork' application in /etc/init)
                        <1> ;; program/executable code continues from specified location as child process,
                        <1> ;; returns back previous code location as parent process, every child after
                        <1> ;; every sys fork uses last image of code and data just prior the fork.
                        <1> ;; Even if the parent code changes data, the child will not see the changed data
                        <1> ;; after the fork. In Retro UNIX 8086 v1, parent's process segment (32KB)
                        <1> ;; was copied to child's process segment (all of code and data) according to
                        <1> ;; original UNIX v1 which copies all of parent process code and data -core-
                        <1> ;; to child space -core- but swaps that core image -of child- on to disk.
                        <1> ;; If I (Erdogan Tan) would use a method of to copy parent's core
                        <1> ;; (complete running image of parent process) to the child process;
                        <1> ;; for big sizes, i would force Retro UNIX 386 v1 to spend many memory pages
                        <1> ;; and times only for a sys fork. (It would excessive reservation for sys fork,
                        <1> ;; because sys fork usually is prior to sys exec; sys exec always establishes
                        <1> ;; a new/fresh core -running space-, by clearing all code/data content).
                        <1> ;; 'Read Only' page flag ensures page fault handler is needed only for a few write
                        <1> ;; attempts between sys fork and sys exec, not more... (I say so by thinking
                        <1> ;; of "/etc/init" content, specially.) sys exec will clear page tables and
                        <1> ;; new/fresh pages will be used to load and run new executable/program.
                        <1> ;; That is what for i have preferred "copy on write", "duplication" method
                        <1> ;; for sharing same read only pages between parent and child processes.
                        <1> ;; That is a pitty i have to use new private flag (AVL bit 0, "duplicated PTE
                        <1> ;; belongs to child" sign) for cooperation on duplicated pages between a parent
                        <1> ;; and it's child processes; otherwise parent process would destroy data belongs
                        <1> ;; to its child or vice versa; or some pages would remain unclaimed
                        <1> ;; -deallocation problem-.
                        <1> ;; Note: to prevent conflicts, read only pages must not be swapped out...
                        <1> ;;
                        <1> ;; WHEN PARENT TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is reset/clear, there is a child uses same page.
                        <1> ;;   - Parent's read only page -previous page- is copied to a new writable page.
                        <1> ;;   - Parent's PTE is updated as writable page, as unique page (AVL=0)
                        <1> ;;   - (Page fault handler whill check this PTE later, if child process causes to
                        <1> ;;     page fault due to write attempt on read only page. Of course, the previous
                        <1> ;;     read only page will be converted to writable and unique page which belongs
                        <1> ;;     to child process.)
                        <1> ;; WHEN CHILD TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is set, there is a parent uses -or was using- same page.
                        <1> ;;   - Same PTE address within parent's page table is checked if it has same page
                        <1> ;;     address or not.
                        <1> ;;   - If parent's PTE has same address, child will continue with a new writable page.
                        <1> ;;     Parent's PTE will point to same (previous) page as writable, unique (AVL=0).
                        <1> ;;   - If parent's PTE has different address, child will continue with it's
                        <1> ;;     own/same page but read only flag (0) will be changed to writable flag (1) and
                        <1> ;;     'duplicated PTE (belongs to child)' flag/sign will be cleared/reset.
                        <1> ;;
                        <1> ;; NOTE: When a child process is terminated, read only flags of parent's page tables
                        <1> ;;       will be set as writable (and unique) in case of child process was using
                        <1> ;;       same pages with duplicated child PTE sign... Depending on sys fork and
                        <1> ;;       duplication method details, it is not possible multiple child processes
                        <1> ;;       were using same page with duplicated PTEs.
                        <1> ;;

1578                              <1> ;;    When a new page is being allocated, swap queue is updated
1579                              <1> ;;    by 'swap_queue_shift' procedure, header of the queue (offset 0)
1580                              <1> ;;    is checked for 'accessed' flag. If the 1st page on the queue
1581                              <1> ;;    is 'accessed' or 'read only', it is dropped from the list;
1582                              <1> ;;    other pages from the 2nd to the last (in [swpq_last]) shifted
1583                              <1> ;;    to head then the 2nd page becomes the 1st and '[swpq_last]'
1584                              <1> ;;    offset value becomes it's previous offset value - 4.
1585                              <1> ;;    If the 1st page of the swap page queue is not 'accessed'
1586                              <1> ;;    the queue/list is not shifted.
1587                              <1> ;;    After the queue/list shift, newly allocated page is added
1588                              <1> ;;    to the tail of the queue at the [swpq_count*4] position.
1589                              <1> ;;    But, if [swpq_count] > 1023, the newly allocated page
1590                              <1> ;;    will not be added to the tail of swap page queue.
1591                              <1> ;;
1592                              <1> ;;    During 'swap_out' procedure, swap page queue is checked for
1593                              <1> ;;    the first non-accessed, writable page in the list,
1594                              <1> ;;    from the head to the tail. The list is shifted to left
1595                              <1> ;;    (to the head) till a non-accessed page will be found in the list.
1596                              <1> ;;    Then, this page     is swapped out (to disk) and then it is dropped
1597                              <1> ;;    from the list by a final swap queue shift. [swpq_count] value
1598                              <1> ;;    is changed. If all pages on the queue' are 'accessed',
1599                              <1> ;;    'insufficient memory' error will be returned ('swap_out'
1600                              <1> ;;    procedure will be failed)...
1601                              <1> ;;
1602                              <1> ;;    Note: If the 1st page of the queue is an 'accessed' page,
1603                              <1> ;;    'accessed' flag of the page will be reset (0) and that page
1604                              <1> ;;    (PTE) will be added to the tail of the queue after
```

```
<1> ;;    the check, if [swpq_count] < 1023. If [swpq_count] = 1024
<1> ;;    the queue will be rotated and the PTE in the head will be
<1> ;;    added to the tail after resetting 'accessed' bit.
<1> ;;
<1> ;;
<1> ;;
<1> ;; SWAP DISK/FILE (with 4096 bytes swapped page blocks)
<1> ;;
<1> ;;  00000000  00000004  00000008  0000000C   ...   size-8    size-4
<1> ;; +---------+---------+---------+---------+-- --+---------+---------+
<1> ;; |descriptr| page(1) | page(2) | page(3) | ... |page(n-1)| page(n) |
<1> ;; +---------+---------+---------+---------+-- --+---------+---------+
<1> ;;
<1> ;; [swpd_next] = the first free block address in swapped page records
<1> ;;                 for next free block search by 'swap_out' procedure.
<1> ;; [swpd_size] = swap disk/file size in sectors (512 bytes)
<1> ;;           NOTE: max. possible swap disk size is 1024 GB
<1> ;;           (entire swap space must be accessed by using
<1> ;;           31 bit offset address)
<1> ;; [swpd_free] = free block (4096 bytes) count in swap disk/file space
<1> ;; [swpd_start] = absolute/start address of the swap disk/file
<1> ;;            0 for file, or beginning sector of the swap partition
<1> ;; [swp_drv] = logical drive description table addr. of swap disk/file
<1> ;;
<1> ;;
<1> ;; Method:
<1> ;;    When the memory (ram) becomes insufficient, page allocation
<1> ;;    procedure swaps out a page from memory to the swap disk
<1> ;;    (partition) or swap file to get a new free page at the memory.
<1> ;;    Swapping out is performed by using swap page queue.
<1> ;;
<1> ;;    Allocation block size of swap disk/file is equal to page size
<1> ;;    (4096 bytes). Swapping address (in sectors) is recorded
<1> ;;    into relevant page file entry as 31 bit physical (logical)
<1> ;;    offset address as 1 bit shifted to left for present flag (0).
<1> ;;    Swapped page address is between 1 and swap disk/file size - 4.
<1> ;;    Absolute physical (logical) address of the swapped page is
<1> ;;    calculated by adding offset value to the swap partition's
<1> ;;    start address. If the swap device (disk) is a virtual disk
<1> ;;    or it is a file, start address of the swap disk/volume is 0,
<1> ;;    and offset value is equal to absolute (physical or logical)
<1> ;;    address/position. (It has not to be ZERO if the swap partition
<1> ;;    is in a partitioned virtual hard disk.)
<1> ;;
<1> ;;    Note: Swap addresses are always specified/declared in sectors,
<1> ;;    not in bytes or     in blocks/zones/clusters (4096 bytes) as unit.
<1> ;;
<1> ;;    Swap disk/file allocation is mapped via 'Swap Allocation Table'
<1> ;;    at memory as similar to 'Memory Allocation Table'.
<1> ;;
<1> ;;    Every bit of Swap Allocation Table repsesents one swap block
<1> ;;    (equal to page size) respectively. Bit 0 of the S.A.T. byte 0
<1> ;;    is reserved for swap disk/file block 0 as descriptor block
<1> ;;    (also for compatibility with PTE). If bit value is ZERO,
<1> ;;    it means relevant (respective) block is in use, and,
<1> ;;    of course, if bit value is 1, it means relevant (respective)
<1> ;;      swap disk/file block is free.
<1> ;;    For example: bit 1 of the byte 128 repsesents block 1025
<1> ;;    (128*8+1) or sector (offset) 8200 on the swap disk or
<1> ;;    byte (offset/position) 4198400 in the swap file.
<1> ;;    4GB swap space is represented via 128KB Swap Allocation Table.
<1> ;;    Initial layout of Swap Allocation Table is as follows:
<1> ;;    ------------------------------------------------------------
<1> ;;    01111111111111111111111 .... 11111111111111111111111111111
<1> ;;    ------------------------------------------------------------
<1> ;;    (0 is reserved block, 1s represent free blocks respectively.)
<1> ;;    (Note: Allocation cell/unit of the table is bit, not byte)
<1> ;;
<1> ;;    ............................................................
<1> ;;
<1> ;;    'swap_out' procedure checks 'free_swap_blocks' count at first,
<1> ;;    then it searches Swap Allocation Table if free count is not
<1> ;;    zero. From begining the [swpd_next] dword value, the first bit
<1> ;;    position with value of 1 on the table is converted to swap
<1> ;;    disk/file offset address, in sectors (not 4096 bytes block).
<1> ;;    'ldrv_write' procedure is called with ldrv (logical drive
<1> ;;    number of physical swap disk or virtual swap disk)
<1> ;;    number, sector offset (not absolute sector -LBA- number),
<1> ;;    and sector count (8, 512*8 = 4096) and buffer adress
<1> ;;    (memory page). That will be a direct disk write procedure.
<1> ;;    (for preventing late memory allocation, significant waiting).
<1> ;;    If disk write procedure returns with error or free count of
<1> ;;    swap blocks is ZERO, 'swap_out' procedure will return with
<1> ;;    'insufficient memory error' (cf=1).
<1> ;;
<1> ;;    (Note: Even if free swap disk/file blocks was not zero,
<1> ;;    any disk write error will not be fixed by 'swap_out' procedure,
<1> ;;    in other words, 'swap_out' will not check the table for other
<1> ;;    free blocks after a disk write error. It will return to
<1> ;;    the caller with error (CF=1) which means swapping is failed.
<1> ;;
<1> ;;    After writing the page on to swap disk/file address/sector,
<1> ;;    'swap_out' procesure returns with that swap (offset) sector
<1> ;;    address (cf=0).
<1> ;;
<1> ;;    ............................................................
<1> ;;
<1> ;;    'swap_in' procedure loads addressed (relevant) swap disk or
<1> ;;    file sectors at specified memory page. Then page allocation
<1> ;;    procedure updates relevant page table entry with 'present'
<1> ;;    attribute. If swap disk or file reading fails there is nothing
<1> ;;    to do, except to terminate the process which is the owner of
<1> ;;    the swapped page.
<1> ;;
<1> ;;    'swap_in' procedure sets the relevant/respective bit value
```

```
                                <1> ;;    in the Swap Allocation Table (as free block). 'swap_in' also
                                <1> ;;    updates [swpd_first] pointer if it is required.
                                <1> ;;
                                <1> ;;    ............................................................
                                <1> ;;
                                <1> ;;    Note: If [swap_enabled] value is ZERO, that means there is not
                                <1> ;;    a swap disk or swap file in use... 'swap_in' and 'swap_out'
                                <1> ;;    procedures ans 'swap page que' procedures will not be active...
                                <1> ;;    'Insufficient memory' error will be returned by 'swap_out'
                                <1> ;;    and 'general protection fault' will be returned by 'swap_in'
                                <1> ;;    procedure, if it is called mistakenly (a wrong value in a PTE).
                                <1> ;;
