<1> ;; Retro Unix 386 v1 - paging method/principles
<1> ;;
<1> ;; 10/10/2014
<1> ;; RETRO UNIX 386 v1 - PAGING METHOD/PRINCIPLES
<1> ;;
<1> ;; KERNEL PAGE MAP: 1 to 1 physical memory page map
<1> ;;    (virtual address = physical address)
<1> ;; KERNEL PAGE TABLES:
<1> ;;    Kernel page directory and all page tables are
<1> ;;    on memory as initialized, as equal to physical memory
<1> ;;    layout. Kernel pages can/must not be swapped out/in.
<1> ;;
<1> ;;    what for: User pages may be swapped out, when accessing
<1> ;;    a page in kernel/system mode, if it would be swapped out,
<1> ;;    kernel would have to swap it in! But it is also may be
<1> ;;    in use by a user process. (In system/kernel mode
<1> ;;    kernel can access all memory pages even if they are
<1> ;;    reserved/allocated for user processes. Swap out/in would
<1> ;;    cause conflicts.)
<1> ;;
<1> ;;    As result of these conditions,
<1> ;;    all kernel pages must be initialized as equal to
<1> ;;    physical layout for preventing page faults.
<1> ;;    Also, calling "allocate page" procedure after
<1> ;;    a page fault can cause another page fault (double fault)
<1> ;;    if all kernel page tables would not be initialized.
<1> ;;
<1> ;;    [first_page] = Beginning of users space, as offset to
<1> ;;    memory allocation table. (double word aligned)
<1> ;;
<1> ;;    [next_page] = first/next free space to be searched
<1> ;;    as offset to memory allocation table. (dw aligned)
<1> ;;
<1> ;;    [last_page] = End of memory (users space), as offset
<1> ;;    to memory allocation table. (double word aligned)
<1> ;;
<1> ;; USER PAGE TABLES:
<1> ;;    Demand paging (& 'copy on write' allocation method) ...
<1> ;;           'ready only' marked copies of the
<1> ;;           parent process's page table entries (for
<1> ;;           same physical memory).
<1> ;;           (A page will be copied to a new page after
<1> ;;            if it causes R/W page fault.)
<1> ;;
<1> ;;    Every user process has own (different)
<1> ;;    page directory and page tables.
<1> ;;
<1> ;;    Code starts at virtual address 0, always.
<1> ;;    (Initial value of EIP is 0 in user mode.)
<1> ;;    (Programs can be written/developed as simple
<1> ;;     flat memory programs.)
<1> ;;
<1> ;; MEMORY ALLOCATION STRATEGY:
<1> ;;    Memory page will be allocated by kernel only
<1> ;;           (in kernel/system mode only).
<1> ;;    * After a
<1> ;;      - 'not present' page fault
<1> ;;      - 'writing attempt on read only page' page fault
<1> ;;    * For loading (opening, reading) a file or disk/drive
<1> ;;    * As responce to 'allocate additional memory blocks'
<1> ;;      request by running process.
<1> ;;    * While creating a process, allocating a new buffer,
<1> ;;      new page tables etc.
<1> ;;
<1> ;;    At first,
<1> ;;    - 'allocate page' procedure will be called;
<1> ;,       if it will return with a valid (>0) physical address
<1> ;;       (that means the relevant M.A.T. bit has been RESET)
<1> ;;       relevant memory page/block will be cleared (zeroed).
<1> ;;    - 'allocate page' will be called for allocating page
<1> ;;       directory, page table and running space (data/code).
<1> ;;    - every successful 'allocate page' call will decrease
<1> ;;      'free_pages' count (pointer).
<1> ;;    - 'out of (insufficient) memory error' will be returned
<1> ;;      if 'free_pages' points to a ZERO.
<1> ;;    - swapping out and swapping in (if it is not a new page)
```

```
143                     <1> ;;      procedures will be called as responce to 'out of memory'
144                     <1> ;;      error except errors caused by attribute conflicts.
145                     <1> ;;     (swapper functions)
146                     <1> ;;
147                     <1> ;;    At second,
148                     <1> ;;    - page directory entry will be updated then page table
149                     <1> ;;      entry will be updated.
150                     <1> ;;
151                     <1> ;; MEMORY ALLOCATION TABLE FORMAT:
152                     <1> ;;    - M.A.T. has a size according to available memory as
153                     <1> ;;      follows:
154                     <1> ;;            - 1 (allocation) bit per 1 page (4096 bytes)
155                     <1> ;;            - a bit with value of 0 means allocated page
156                     <1> ;;            - a bit with value of 1 means a free page
157                     <1> ;,    - 'free_pages' pointer holds count of free pages
158                     <1> ;;      depending on M.A.T.
159                     <1> ;;          (NOTE: Free page count will not be checked
160                     <1> ;;          again -on M.A.T.- after initialization.
161                     <1> ;;          Kernel will trust on initial count.)
162                     <1> ;,    - 'free_pages' count will be decreased by allocation
163                     <1> ;;      and it will be increased by deallocation procedures.
164                     <1> ;;
165                     <1> ;;    - Available memory will be calculated during
166                     <1> ;;      the kernel's initialization stage (in real mode).
167                     <1> ;;      Memory allocation table and kernel page tables
168                     <1> ;;      will be formatted/sized as result of available
169                     <1> ;;      memory calculation before paging is enabled.
170                     <1> ;;
171                     <1> ;; For 4GB Available/Present Memory: (max. possible memory size)
172                     <1> ;;    - Memory Allocation Table size will be 128 KB.
173                     <1> ;;    - Memory allocation for kernel page directory size
174                     <1> ;;      is always 4 KB. (in addition to total allocation size
175                     <1> ;;      for page tables)
176                     <1> ;;    - Memory allocation for kernel page tables (1024 tables)
177                     <1> ;;      is 4 MB (1024*4*1024 bytes).
178                     <1> ;;    - User (available) space will be started
179                     <1> ;;      at 6th MB of the memory (after 1MB+4MB).
180                     <1> ;;    - The first 640 KB is for kernel's itself plus
181                     <1> ;;      memory allocation table and kernel's page directory
182                     <1> ;;      (D0000h-EFFFFh may be used as kernel space...)
183                     <1> ;;    - B0000h to B7FFFh address space (32 KB) will be used
184                     <1> ;;      for buffers.
185                     <1> ;;    - ROMBIOS, VIDEO BUFFER and VIDEO ROM space are reserved.
186                     <1> ;,      (A0000h-AFFFFh, C0000h-CFFFFh, F0000h-FFFFFh)
187                     <1> ;;    - Kernel page tables start at 100000h (2nd MB)
188                     <1> ;;
189                     <1> ;; For 1GB Available Memory:
190                     <1> ;;    - Memory Allocation Table size will be 32 KB.
191                     <1> ;;    - Memory allocation for kernel page directory size
192                     <1> ;;      is always 4 KB. (in addition to total allocation size
193                     <1> ;;      for page tables)
194                     <1> ;;    - Memory allocation for kernel page tables (256 tables)

225                     <1> ;; Note: Dirty bit (PTE bit 6) may be used instead of AVL bit 0 (PTE bit 9)
226                     <1> ;;       -while R/W bit is 0-.
227                     <1> ;;
228                     <1> ;; Duplicate page tables with writable pages (the 1st sys fork in the process):
229                     <1> ;; # Parent's Page Table Entries are updated to point same pages as read only,
230                     <1> ;;   as duplicated PTE bit  -AVL bit 0, PTE bit 9- are reset/clear.
231                     <1> ;; # Then Parent's Page Table is copied to Child's Page Table.
232                     <1> ;; # Child's Page Table Entries are updated as duplicated child bit
233                     <1> ;;   -AVL bit 0, PTE bit 9- is set.
234                     <1> ;;
235                     <1> ;; Duplicate page tables with read only pages (several sys fork system calls):
236                     <1> ;; # Parent's read only pages are copied to new child pages.
237                     <1> ;;   Parent's PTE attributes are not changed.
238                     <1> ;;   (Because, there is another parent-child fork before this fork! We must not
239                     <1> ;;    destroy/mix previous fork result).
240                     <1> ;; # Child's Page Table Entries (which are corresponding to Parent's
241                     <1> ;;   read only pages) are set as writable (while duplicated PTE bit is clear).
242                     <1> ;; # Parent's PTEs with writable page attribute are updated to point same pages
243                     <1> ;;   as read only, (while) duplicated PTE bit is reset (clear).
244                     <1> ;; # Parent's Page Table Entries (with writable page attribute) are duplicated
245                     <1> ;;   as Child's Page Table Entries without copying actual page.
246                     <1> ;; # Child 's Page Table Entries (which are corresponding to Parent's writable
247                     <1> ;;   pages) are updated as duplicated PTE bit (AVL bit 0, PTE bit 9- is set.
```

```
                        <1> ;;
                        <1> ;; !? WHAT FOR (duplication after duplication):
                        <1> ;; In UNIX method for sys fork (a typical 'fork' application in /etc/init)
                        <1> ;; program/executable code continues from specified location as child process,
                        <1> ;; returns back previous code location as parent process, every child after
                        <1> ;; every sys fork uses last image of code and data just prior the fork.
                        <1> ;; Even if the parent code changes data, the child will not see the changed data
                        <1> ;; after the fork. In Retro UNIX 8086 v1, parent's process segment (32KB)
                        <1> ;; was copied to child's process segment (all of code and data) according to
                        <1> ;; original UNIX v1 which copies all of parent process code and data -core-
                        <1> ;; to child space -core- but swaps that core image -of child- on to disk.
                        <1> ;; If I (Erdogan Tan) would use a method of to copy parent's core
                        <1> ;; (complete running image of parent process) to the child process;
                        <1> ;; for big sizes, i would force Retro UNIX 386 v1 to spend many memory pages
                        <1> ;; and times only for a sys fork. (It would excessive reservation for sys fork,
                        <1> ;; because sys fork usually is prior to sys exec; sys exec always establishes
                        <1> ;; a new/fresh core -running space-, by clearing all code/data content).
                        <1> ;; 'Read Only' page flag ensures page fault handler is needed only for a few write
                        <1> ;; attempts between sys fork and sys exec, not more... (I say so by thinking
                        <1> ;; of "/etc/init" content, specially.) sys exec will clear page tables and
                        <1> ;; new/fresh pages will be used to load and run new executable/program.
                        <1> ;; That is what for i have preferred "copy on write", "duplication" method
                        <1> ;; for sharing same read only pages between parent and child processes.
                        <1> ;; That is a pitty i have to use new private flag (AVL bit 0, "duplicated PTE
                        <1> ;; belongs to child" sign) for cooperation on duplicated pages between a parent
                        <1> ;; and it's child processes; otherwise parent process would destroy data belongs
                        <1> ;; to its child or vice versa; or some pages would remain unclaimed
                        <1> ;; -deallocation problem-.
                        <1> ;; Note: to prevent conflicts, read only pages must not be swapped out...
                        <1> ;;
                        <1> ;; WHEN PARENT TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is reset/clear, there is a child uses same page.
                        <1> ;;   - Parent's read only page -previous page- is copied to a new writable page.
                        <1> ;;   - Parent's PTE is updated as writable page, as unique page (AVL=0)
                        <1> ;;   - (Page fault handler whill check this PTE later, if child process causes to
                        <1> ;;     page fault due to write attempt on read only page. Of course, the previous
                        <1> ;;     read only page will be converted to writable and unique page which belongs
                        <1> ;;     to child process.)
                        <1> ;; WHEN CHILD TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is set, there is a parent uses -or was using- same page.
                        <1> ;;   - Same PTE address within parent's page table is checked if it has same page
                        <1> ;;     address or not.
                        <1> ;;   - If parent's PTE has same address, child will continue with a new writable page.
                        <1> ;;     Parent's PTE will point to same (previous) page as writable, unique (AVL=0).
                        <1> ;;   - If parent's PTE has different address, child will continue with it's
                        <1> ;;     own/same page but read only flag (0) will be changed to writable flag (1) and
                        <1> ;;     'duplicated PTE (belongs to child)' flag/sign will be cleared/reset.
                        <1> ;;
                        <1> ;; NOTE: When a child process is terminated, read only flags of parent's page tables
                        <1> ;;       will be set as writable (and unique) in case of child process was using
                        <1> ;;       same pages with duplicated child PTE sign... Depending on sys fork and
                        <1> ;;       duplication method details, it is not possible multiple child processes
                        <1> ;;       were using same page with duplicated PTEs.
                        <1> ;;

1631                    <1> ;;    When the memory (ram) becomes insufficient, page allocation
1632                    <1> ;;    procedure swaps out a page from memory to the swap disk
1633                    <1> ;;    (partition) or swap file to get a new free page at the memory.
1634                    <1> ;;    Swapping out is performed by using swap page queue.
1635                    <1> ;;
1636                    <1> ;;    Allocation block size of swap disk/file is equal to page size
1637                    <1> ;;    (4096 bytes). Swapping address (in sectors) is recorded
1638                    <1> ;;    into relevant page file entry as 31 bit physical (logical)
1639                    <1> ;;    offset address as 1 bit shifted to left for present flag (0).
1640                    <1> ;;    Swapped page address is between 1 and swap disk/file size - 4.
1641                    <1> ;;    Absolute physical (logical) address of the swapped page is
1642                    <1> ;;    calculated by adding offset value to the swap partition's
1643                    <1> ;;    start address. If the swap device (disk) is a virtual disk
1644                    <1> ;;    or it is a file, start address of the swap disk/volume is 0,
1645                    <1> ;;    and offset value is equal to absolute (physical or logical)
1646                    <1> ;;    address/position. (It has not to be ZERO if the swap partition
1647                    <1> ;;    is in a partitioned virtual hard disk.)
1648                    <1> ;;
1649                    <1> ;;    Note: Swap addresses are always specified/declared in sectors,
1650                    <1> ;;    not in bytes or     in blocks/zones/clusters (4096 bytes) as unit.
1651                    <1> ;;
1652                    <1> ;;    Swap disk/file allocation is mapped via 'Swap Allocation Table'
1653                    <1> ;;    at memory as similar to 'Memory Allocation Table'.
1654                    <1> ;;
1655                    <1> ;;    Every bit of Swap Allocation Table repsesents one swap block
1656                    <1> ;;    (equal to page size) respectively. Bit 0 of the S.A.T. byte 0
1657                    <1> ;;    is reserved for swap disk/file block 0 as descriptor block
1658                    <1> ;;    (also for compatibility with PTE). If bit value is ZERO,
1659                    <1> ;;    it means relevant (respective) block is in use, and,
1660                    <1> ;;    of course, if bit value is 1, it means relevant (respective)
1661                    <1> ;;      swap disk/file block is free.
1662                    <1> ;;    For example: bit 1 of the byte 128 repsesents block 1025
1663                    <1> ;;    (128*8+1) or sector (offset) 8200 on the swap disk or
1664                    <1> ;;    byte (offset/position) 4198400 in the swap file.
1665                    <1> ;;    4GB swap space is represented via 128KB Swap Allocation Table.
1666                    <1> ;;    Initial layout of Swap Allocation Table is as follows:
1667                    <1> ;;    ------------------------------------------------------------
1668                    <1> ;;    01111111111111111111111 .... 11111111111111111111111111111
1669                    <1> ;;    ------------------------------------------------------------
1670                    <1> ;;    (0 is reserved block, 1s represent free blocks respectively.)
1671                    <1> ;;    (Note: Allocation cell/unit of the table is bit, not byte)
1672                    <1> ;;
1673                    <1> ;;    ............................................................
1674                    <1> ;;
1675                    <1> ;;    'swap_out' procedure checks 'free_swap_blocks' count at first,
1676                    <1> ;;    then it searches Swap Allocation Table if free count is not
1677                    <1> ;;    zero. From begining the [swpd_next] dword value, the first bit
1678                    <1> ;;    position with value of 1 on the table is converted to swap
1679                    <1> ;;    disk/file offset address, in sectors (not 4096 bytes block).
1680                    <1> ;;    'ldrv_write' procedure is called with ldrv (logical drive
1681                    <1> ;;    number of physical swap disk or virtual swap disk)
1682                    <1> ;;    number, sector offset (not absolute sector -LBA- number),
1683                    <1> ;;    and sector count (8, 512*8 = 4096) and buffer adress
1684                    <1> ;;    (memory page). That will be a direct disk write procedure.
1685                    <1> ;;    (for preventing late memory allocation, significant waiting).
1686                    <1> ;;    If disk write procedure returns with error or free count of
1687                    <1> ;;    swap blocks is ZERO, 'swap_out' procedure will return with
1688                    <1> ;;    'insufficient memory error' (cf=1).
1689                    <1> ;;
1690                    <1> ;;    (Note: Even if free swap disk/file blocks was not zero,
1691                    <1> ;;    any disk write error will not be fixed by 'swap_out' procedure,
1692                    <1> ;;    in other words, 'swap_out' will not check the table for other
1693                    <1> ;;    free blocks after a disk write error. It will return to
1694                    <1> ;;    the caller with error (CF=1) which means swapping is failed.
1695                    <1> ;;
1696                    <1> ;;    After writing the page on to swap disk/file address/sector,
1697                    <1> ;;    'swap_out' procesure returns with that swap (offset) sector
1698                    <1> ;;    address (cf=0).
1699                    <1> ;;
1700                    <1> ;;    ............................................................
1701                    <1> ;;
1702                    <1> ;;    'swap_in' procedure loads addressed (relevant) swap disk or
1703                    <1> ;;    file sectors at specified memory page. Then page allocation
1704                    <1> ;;    procedure updates relevant page table entry with 'present'
1705                    <1> ;;    attribute. If swap disk or file reading fails there is nothing
1706                    <1> ;;    to do, except to terminate the process which is the owner of
1707                    <1> ;;    the swapped page.
1708                    <1> ;;
1709                    <1> ;;    'swap_in' procedure sets the relevant/respective bit value
1710                    <1> ;;    in the Swap Allocation Table (as free block). 'swap_in' also
1711                    <1> ;;    updates [swpd_first] pointer if it is required.
1712                    <1> ;;
