3033                    <1> ;; MEMORY ALLOCATION STRATEGY:
3034                    <1> ;;    Memory page will be allocated by kernel only
3035                    <1> ;;           (in kernel/system mode only).
3036                    <1> ;;    * After a
3037                    <1> ;;      - 'not present' page fault
3038                    <1> ;;      - 'writing attempt on read only page' page fault
3039                    <1> ;;    * For loading (opening, reading) a file or disk/drive
3040                    <1> ;;    * As responce to 'allocate additional memory blocks'
3041                    <1> ;;      request by running process.
3042                    <1> ;;    * While creating a process, allocating a new buffer,
3043                    <1> ;;      new page tables etc.
3044                    <1> ;;
3045                    <1> ;;    At first,
3046                    <1> ;;    - 'allocate page' procedure will be called;
3047                    <1> ;,       if it will return with a valid (>0) physical address
3048                    <1> ;;       (that means the relevant M.A.T. bit has been RESET)
3049                    <1> ;;       relevant memory page/block will be cleared (zeroed).
3050                    <1> ;;    - 'allocate page' will be called for allocating page
3051                    <1> ;;       directory, page table and running space (data/code).
3052                    <1> ;;    - every successful 'allocate page' call will decrease
3053                    <1> ;;      'free_pages' count (pointer).
3054                    <1> ;;    - 'out of (insufficient) memory error' will be returned
3055                    <1> ;;      if 'free_pages' points to a ZERO.
3056                    <1> ;;    - swapping out and swapping in (if it is not a new page)
3057                    <1> ;;      procedures will be called as responce to 'out of memory'
3058                    <1> ;;      error except errors caused by attribute conflicts.
3059                    <1> ;;     (swapper functions)
3060                    <1> ;;
3061                    <1> ;;    At second,
3062                    <1> ;;    - page directory entry will be updated then page table
3063                    <1> ;;      entry will be updated.
3064                    <1> ;;
3065                    <1> ;; MEMORY ALLOCATION TABLE FORMAT:
3066                    <1> ;;    - M.A.T. has a size according to available memory as
3067                    <1> ;;      follows:
3068                    <1> ;;            - 1 (allocation) bit per 1 page (4096 bytes)
3069                    <1> ;;            - a bit with value of 0 means allocated page
3070                    <1> ;;            - a bit with value of 1 means a free page
3071                    <1> ;,    - 'free_pages' pointer holds count of free pages
3072                    <1> ;;      depending on M.A.T.
3073                    <1> ;;           (NOTE: Free page count will not be checked
3074                    <1> ;;           again -on M.A.T.- after initialization.
3075                    <1> ;;           Kernel will trust on initial count.)
3076                    <1> ;,    - 'free_pages' count will be decreased by allocation
3077                    <1> ;;      and it will be increased by deallocation procedures.
3078                    <1> ;;
3079                    <1> ;;    - Available memory will be calculated during
3080                    <1> ;;      the kernel's initialization stage (in real mode).
3081                    <1> ;;      Memory allocation table and kernel page tables
3082                    <1> ;;      will be formatted/sized as result of available
3083                    <1> ;;      memory calculation before paging is enabled.
3084                    <1> ;;

3149                    <1> ;; Duplicate page tables with read only pages (several sys fork system calls):
3150                    <1> ;; # Parent's read only pages are copied to new child pages.
3151                    <1> ;;   Parent's PTE attributes are not changed.
3152                    <1> ;;   (Because, there is another parent-child fork before this fork! We must not
3153                    <1> ;;    destroy/mix previous fork result).
3154                    <1> ;; # Child's Page Table Entries (which are corresponding to Parent's
3155                    <1> ;;   read only pages) are set as writable (while duplicated PTE bit is clear).
3156                    <1> ;; # Parent's PTEs with writable page attribute are updated to point same pages
3157                    <1> ;;   as read only, (while) duplicated PTE bit is reset (clear).
3158                    <1> ;; # Parent's Page Table Entries (with writable page attribute) are duplicated
3159                    <1> ;;   as Child's Page Table Entries without copying actual page.
3160                    <1> ;; # Child 's Page Table Entries (which are corresponding to Parent's writable
3161                    <1> ;;   pages) are updated as duplicated PTE bit (AVL bit 0, PTE bit 9- is set.
3162                    <1> ;;
3163                    <1> ;; !? WHAT FOR (duplication after duplication):
3164                    <1> ;; In UNIX method for sys fork (a typical 'fork' application in /etc/init)
3165                    <1> ;; program/executable code continues from specified location as child process,
3166                    <1> ;; returns back previous code location as parent process, every child after
3167                    <1> ;; every sys fork uses last image of code and data just prior the fork.
3168                    <1> ;; Even if the parent code changes data, the child will not see the changed data
3169                    <1> ;; after the fork. In Retro UNIX 8086 v1, parent's process segment (32KB)
3170                    <1> ;; was copied to child's process segment (all of code and data) according to
3171                    <1> ;; original UNIX v1 which copies all of parent process code and data -core-
3172                    <1> ;; to child space -core- but swaps that core image -of child- on to disk.
3173                    <1> ;; If I (Erdogan Tan) would use a method of to copy parent's core
3174                    <1> ;; (complete running image of parent process) to the child process;
3175                    <1> ;; for big sizes, i would force Retro UNIX 386 v1 to spend many memory pages
3176                    <1> ;; and times only for a sys fork. (It would excessive reservation for sys fork,
3177                    <1> ;; because sys fork usually is prior to sys exec; sys exec always establishes
3178                    <1> ;; a new/fresh core -running space-, by clearing all code/data content).
3179                    <1> ;; 'Read Only' page flag ensures page fault handler is needed only for a few write
3180                    <1> ;; attempts between sys fork and sys exec, not more... (I say so by thinking
3181                    <1> ;; of "/etc/init" content, specially.) sys exec will clear page tables and
3182                    <1> ;; new/fresh pages will be used to load and run new executable/program.
3183                    <1> ;; That is what for i have preferred "copy on write", "duplication" method
3184                    <1> ;; for sharing same read only pages between parent and child processes.
3185                    <1> ;; That is a pitty i have to use new private flag (AVL bit 0, "duplicated PTE
3186                    <1> ;; belongs to child" sign) for cooperation on duplicated pages between a parent
3187                    <1> ;; and it's child processes; otherwise parent process would destroy data belongs
3188                    <1> ;; to its child or vice versa; or some pages would remain unclaimed
3189                    <1> ;; -deallocation problem-.
3190                    <1> ;; Note: to prevent conflicts, read only pages must not be swapped out...
3191                    <1> ;;
3192                    <1> ;; WHEN PARENT TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
3193                    <1> ;; # Page fault handler will do those:
3194                    <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
3195                    <1> ;;   - If it is reset/clear, there is a child uses same page.
3196                    <1> ;;   - Parent's read only page -previous page- is copied to a new writable page.
3197                    <1> ;;   - Parent's PTE is updated as writable page, as unique page (AVL=0)
3198                    <1> ;;   - (Page fault handler whill check this PTE later, if child process causes to
3199                    <1> ;;     page fault due to write attempt on read only page. Of course, the previous
3200                    <1> ;;     read only page will be converted to writable and unique page which belongs
3201                    <1> ;;     to child process.)
3202                    <1> ;; WHEN CHILD TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
3203                    <1> ;; # Page fault handler will do those:
3204                    <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
3205                    <1> ;;   - If it is set, there is a parent uses -or was using- same page.
3206                    <1> ;;   - Same PTE address within parent's page table is checked if it has same page
3207                    <1> ;;     address or not.
3208                    <1> ;;   - If parent's PTE has same address, child will continue with a new writable page.
3209                    <1> ;;     Parent's PTE will point to same (previous) page as writable, unique (AVL=0).
3210                    <1> ;;   - If parent's PTE has different address, child will continue with it's
3211                    <1> ;;     own/same page but read only flag (0) will be changed to writable flag (1) and
3212                    <1> ;;     'duplicated PTE (belongs to child)' flag/sign will be cleared/reset.
3213                    <1> ;;
3214                    <1> ;; NOTE: When a child process is terminated, read only flags of parent's page tables
3215                    <1> ;;       will be set as writable (and unique) in case of child process was using
3216                    <1> ;;       same pages with duplicated child PTE sign... Depending on sys fork and
3217                    <1> ;;       duplication method details, it is not possible multiple child processes
3218                    <1> ;;       were using same page with duplicated PTEs.
3219                    <1> ;;

4584                              <1> ;;    (4096 bytes). Swapping address (in sectors) is recorded
4585                              <1> ;;    into relevant page file entry as 31 bit physical (logical)
4586                              <1> ;;    offset address as 1 bit shifted to left for present flag (0).
4587                              <1> ;;    Swapped page address is between 1 and swap disk/file size - 4.
4588                              <1> ;;    Absolute physical (logical) address of the swapped page is
```

```
;;    calculated by adding offset value to the swap partition's
;;    start address. If the swap device (disk) is a virtual disk
;;    or it is a file, start address of the swap disk/volume is 0,
;;    and offset value is equal to absolute (physical or logical)
;;    address/position. (It has not to be ZERO if the swap partition
;;    is in a partitioned virtual hard disk.)
;;
;;    Note: Swap addresses are always specified/declared in sectors,
;;    not in bytes or     in blocks/zones/clusters (4096 bytes) as unit.
;;
;;    Swap disk/file allocation is mapped via 'Swap Allocation Table'
;;    at memory as similar to 'Memory Allocation Table'.
;;
;;    Every bit of Swap Allocation Table repsesents one swap block
;;    (equal to page size) respectively. Bit 0 of the S.A.T. byte 0
;;    is reserved for swap disk/file block 0 as descriptor block
;;    (also for compatibility with PTE). If bit value is ZERO,
;;    it means relevant (respective) block is in use, and,
;;    of course, if bit value is 1, it means relevant (respective)
;;      swap disk/file block is free.
;;    For example: bit 1 of the byte 128 repsesents block 1025
;;    (128*8+1) or sector (offset) 8200 on the swap disk or
;;    byte (offset/position) 4198400 in the swap file.
;;    4GB swap space is represented via 128KB Swap Allocation Table.
;;    Initial layout of Swap Allocation Table is as follows:
;;    ------------------------------------------------------------
;;    01111111111111111111111 .... 11111111111111111111111111111
;;    ------------------------------------------------------------
;;    (0 is reserved block, 1s represent free blocks respectively.)
;;    (Note: Allocation cell/unit of the table is bit, not byte)
;;
;;    ............................................................
;;    'swap_out' procedure checks 'free_swap_blocks' count at first,
;;    then it searches Swap Allocation Table if free count is not
;;    zero. From begining the [swpd_next] dword value, the first bit
;;    position with value of 1 on the table is converted to swap
;;    disk/file offset address, in sectors (not 4096 bytes block).
;;    'ldrv_write' procedure is called with ldrv (logical drive
;;    number of physical swap disk or virtual swap disk)
;;    number, sector offset (not absolute sector -LBA- number),
;;    and sector count (8, 512*8 = 4096) and buffer adress
;;    (memory page). That will be a direct disk write procedure.
;;    (for preventing late memory allocation, significant waiting).
;;    If disk write procedure returns with error or free count of
;;    swap blocks is ZERO, 'swap_out' procedure will return with
;;    'insufficient memory error' (cf=1).
;;
;;    (Note: Even if free swap disk/file blocks was not zero,
;;    any disk write error will not be fixed by 'swap_out' procedure,
;;    in other words, 'swap_out' will not check the table for other
;;    free blocks after a disk write error. It will return to
;;    the caller with error (CF=1) which means swapping is failed.
;;
;;    After writing the page on to swap disk/file address/sector,
;;    'swap_out' procesure returns with that swap (offset) sector
;;    address (cf=0).
;;
;;    ............................................................
;;
;;    'swap_in' procedure loads addressed (relevant) swap disk or
;;    file sectors at specified memory page. Then page allocation
;;    procedure updates relevant page table entry with 'present'
;;    attribute. If swap disk or file reading fails there is nothing
;;    to do, except to terminate the process which is the owner of
;;    the swapped page.
;;
;;    'swap_in' procedure sets the relevant/respective bit value
;;    in the Swap Allocation Table (as free block). 'swap_in' also
;;    updates [swpd_first] pointer if it is required.
;;
;;    ............................................................
;;
;;    Note: If [swap_enabled] value is ZERO, that means there is not
;;    a swap disk or swap file in use... 'swap_in' and 'swap_out'
;;    procedures ans 'swap page que' procedures will not be active...
;;    'Insufficient memory' error will be returned by 'swap_out'
;;    and 'general protection fault' will be returned by 'swap_in'
;;    procedure, if it is called mistakenly (a wrong value in a PTE).
;;
